

Press Release

Sulz am Neckar, 29th October 2018

The new ScalpelCric:

The first cricothyrotomy set according to the Difficult Airway Society guidelines.

In 2015 the Difficult Airway Society (DAS) has set new guidelines in the area of cricothyrotomy. In this guidelines it is especially referred to front of neck access management in the „Can't Intubate – Can't Oxygenate“ scenario. In this case, the execution of a surgical cricothyrotomy according to the scalpel technique is recommended.

To enhance the success rate of this technique VBM as the first manufacturer has reacted to this recommendations and developed a new cricothyrotomy set according to the DAS guidelines: ScalpelCric. The now available ScalpelCric consists of all important components, facilitating surgical cricothyrotomy in emergency situations.

The set is packed in a specific sterile pouch with each component organised in the order of use. This reduces the risk of confusion at the critical time of the procedure.

Further information about ScalpelCric including a new application video:
