

## Press Release

Sulz am Neckar, 17th June 2019

### **The new Tourniquet Touch:**

#### **A new generation of Tourniquets with Touch Screen Technology**

Surgical indications for upper and lower extremities are extremely vast, especially for plastic and reconstructive surgery. These techniques usually require a bloodless surgical field and request a reliable system to generate and monitor the blood impairment.

To enhance patient safety and to provide best possible confidence to users, the company VBM developed a new electronic tourniquet with very robust housing including the latest technologies for touch interface: Tourniquet Touch. Intuitive features such as Fast Choice Buttons allow safe and quick settings or adjustments of pressure and operating time in only two touches, while the 8 inch display of the Tourniquet Touch guarantees a clear view throughout the entire operation procedure.

Due to the possibility of data transfer for remote technical analysis and diagnostic, local maintenance can be reduced.

The now available Tourniquet Touch is supplied in two versions:

The TT20 with two channels for bloodless field operations, bilateral surgery or IVRA.

The TT15 for combination of bloodless field operations (1 channel) and irrigation purposes (1 channel).

Tourniquet Touch is also featuring a specific mobile stand for reinforcing safety, mobility and hygiene for operating room environment.
